Applicant:

MEMOREC BIOTEC GMBH (DE)

Classification:

- international:

C12N5/06; G01N33/53

- european:

C12N5/06B8P; G01N33/68V2

Application number: EP20030025506 20031106 Priority number(s): EP20030025506 20031106

Abstract of EP1529838

A cell population comprising at least 5% neural stem cells, the stem cells being characterized by an expression of ASCT2 or KIAA0152, is new. - Independent claims are also included for the following: - (1) a method for isolating the cell population cited above; - (2) a medicament comprising the above cell population; and - (3) a monoclonal antiboc directed against ASCT2. - ACTIVITY - Neuroprotective; Nootropic; Antiparkinsonian; Cerebroprotective; Vasotropic; No biological data given. - MECHANISM OF ACTION - Cell Therapy.

Beschreibung

[0001] Die vorliegende Erfindung betrifft Zellpopulationen von neuralen Vorläuferzellen bzw. neuralen Stammzellen sowie Verfahren zur Isolierung entsprechender Zellen.

[0002] Der Ausgangspunkt für die Generierung der über tausend verschiedenen neuronalen und glialen Zelltypen des Nervensystems von Vertebraten sind multipotente, neurale Stammzellen des embryonalen Neuroepitheliums (Williams, B. P., Read, J. & Price, J. (1991): The generation of neurons and oligodendrocytes from a common precursor cell. Neuron 7(4), 685-93), (Davis, A. A. & Temple, S. (1994): A self-renewing multipotential stem cell in embryonic rat cerebral cortex. Nature 372(6503), 263-6), (Weiss, S., Dunne, C., Hewson, J., Wohl, C., Wheatley, M., Peterson, A. C. & Reynolds, B. A. (1996): Multipotent CNS stem cells are present in the adult mammalian spinal cord and ventricular neuroaxis. J Neurosci 16(23), 7599-609).

[0003] In den vergangenen Jahren wurde durch verschiedene Arbeitsgruppen gezeigt, dass solche sich selbst erneuernden, multipotenten Vorläuferzellen nicht nur während der Entwicklung, sondern auch im adulten Gehirn zu finden sind (Gage, F. H. (2000): Mammalian neural stem cells. *Science* 287(5457), 1433-8). Vor allem um die lateralen Ventrikel des Vorderhirns findet die Bildung von neuralen Vorläuferzellen lebenslang statt. Diese wandern hauptsächlich, wenn auch nicht exklusiv, in den Bulbus olfaktorius, um dort in GABA-erge Interneurone zu differenzieren.

[0004] Über die genaue Lokalisation der multipotenten Stammzellen, die dieser sekundären Neurogenese zugrunde liegen, wird derzeit noch spekuliert: Johansson et al. beschrieben ependymale Zellen entlang des Lumen der adulten, ventrikulären Zone mit den Eigenschaften multipotenter Stammzellen (Johansson, C. B., Svensson, M., Wallstedt, L., Janson, A. M. & Frisen, J. (1999b): Neural stem cells in the adult human brain. Exp. Cell Res 253(2), 733-6), während Doetsch et al. Astrocyten der subventrikulären Zone als multipotente Stammzellen identifizierten (Doetsch, F., Caille, I., Lim, D. A., Garcia-Verdugo, J. M. & Alvarez-Buylla, A. (1999): Subventricular zone astrocytes are neural stem cells in the adult mammalian brain. Cell 97(6), 703-16). Eine absolut eindeutige Identifizierung dieser adulten Stammzellen in vivo ist jedoch bis heute, hauptsächlich mangels geeigneter Marker, nicht gelungen.

[0005] Neben ihrer Bedeutung im olfaktorischen System ist das therapeutische Potential der adulten Stammzellen von besonderem Interesse. Aufgrund ihrer Multipotenz weisen neurale Stammzellen bemerkenswerte Formbarkeit auf und könnten daher durch Zusatz von verschiedenen Faktoren zur Erzeugung verschiedener Neuronentypen eingesetzt werden. Die anschließende Transplantation der so entwickelten spezialisierten Zellen könnte zur Behandlung von neurologischen Krankheiten Alzheimer, Parkinson, Folgen von

Schädel-Hirn-Traumata und Schlaganfall beitragen. Voraussetzung dafür ist die Charakterisierung der verschiedenen, neuralen Differenzierungsstufen sowie die Identifizierung der Faktoren, die die Differenzierungsprogramme der Stammzellen steuern. Gegenüber den embryonalen Stammzellen haben die adulten den Vorteil, dass sie erstens keine abstoßende Immunreaktion auslösen würden, weil sie dem Körper des Patienten entstammen, folglich ihre Transplantation ohne Immunsuppression erfolgen könnte, und zweitens ihre Gewinnung ethisch unbedenklich ist.

[0006] Die Erforschung der Eigenschaften neuraler Stammzellen und embronaler Stammzellen des Menschen ist aus ethischen Aspekten praktisch nicht oder nur sehr eingeschränkt möglich. Daher wurden alle explorativen Arbeiten ausgehend von Mäusen und Mauszellen durchgeführt. Wie bereits beschrieben war die Isolierung von neuralen Stammzellen bisher nicht möglich, da dieser Zelltyp nicht eindeutig charakterisiert war und keine geeigneten Marker zur Identifizierung und Anreicherung zur Verfügung standen.

[0007] Aufgabe der vorliegenden Erfindung war es daher Verfahren zu entwickeln, die eine Isolation von neuralen Vorläuferzellen und neuralen Stammzellen erlauben und entsprechende Zellpopulation, enthaltend diese Zelle bereitzustellen.

[0008] Erfindungsgemäß wird die Aufgabe gelöst durch die Identifizierung von Markern, die entsprechende Zellen aufweisen.

[0009] Marker ist ein Gen, das mit Hilfe der Serial Analysis of Genexpression (SAGE) in entsprechenden Zellen gefunden wird.

[0010] Methodisch beruht SAGE auf der Isolierung von 14 bp großen DNA Fragmenten (Tags), die jeweils charakteristisch für eine mRNA-Spezies sind. Die Tags, repräsentativ für alle in der zu untersuchenden Zelle vorliegenden mRNA Moleküle, werden zu langen Polymeren verbunden, die im letzten Schritt der Methode sequenziert werden. Die Frequenz, mit der ein Tag sequenziert wird, ist direkt proportional zur Kopienzahl der mRNA-Moleküle im untersuchten Ausgangsmaterial (Velculescu, V. E., Zhang, L., Vogelstein, B. & Kinzler, K. W. (1995): Serial analysis of gene expression. Science 270(5235), 484-7). Durch die computerunterstützte Auswertung der Sequenzdaten entsteht ein digitales Expressionsprofil, das beliebig oft und ohne zusätzliche Laborarbeit mit Expressionsprofilen anderer Gewebe verglichen werden kann (Meta-Analyse).

[0011] Den so identifizierten Gene sind eindeutigen Nummern zugeordnet, die beispielsweise als SAGEmap von National Center for Biotechnology Information (NCBI) bereitgestellt werden (www.ncbi.nlm.nin.gov/SAGE).

[0012] Gegenstand der Erfindung sind zum einen Zellpopulationen, bei denen mindestens 5% der Zellen neurale Vorläuferzellen sind, die wenigstens einen der in Liste A oder Liste B aufgeführten Marker aufweisen. [0013] Bevorzugt weisen entsprechende neurale Vor-

läuferzellen wenigstens zwei, drei, vier oder fünf der in Liste A oder B aufgeführten Marker auf.

[0014] In bevorzugten Ausführungsformen weisen entsprechende neurale Vorläuferzellen keinen der in Liste C aufgeführten Marker auf.

[0015] Bevorzugt ist der Gehalt an neuralen Vorläuferzellen in der Zellpopulation hoch, d.h. mindestens 10%, bevorzugt mindestens 25%, noch mehr bevorzugt mehr als 50% und am meisten bevorzugt über 90%.

[0016] Entsprechende neurale Vorläuferzellen sind vorzugsweise aus Hirngewebe erhältlich.

[0017] In einer Ausführungsform handelt es sich dabei um eine murine Zellpopulation.

[0018] Gegenstand der Erfindung ist auch ein Verfahren zur Isolierung einer entsprechenden Zellpopulation mit folgenden Schritten:

entweder

- Entnahme einer Probe aus dem Hirn
- Isolieren der neuralen Vorläuferzellen unter Verwendung der angegebenen Marker

oder

- Differenzierung von embryonalen Stammzellen zu 25 neuralen Vorläuferzellen,
- Isolieren der neuralen Vorläuferzellen unter Verwendung der angegebenen Marker

oder

- Trans-Differenzierung von adulten, nicht neuralen Stammzellen zu neuralen Vorläuferzellen,
- Isolieren der neuralen Vorläuferzellen unter Verwendung der angegebenen Marker

oder

- Differenzierung von adulten, neuralen Stammzellen zu neuralen Vorläuferzellen,
- Isolieren der neuralen Vorläuferzeilen unter Verwendung der angegebenen Marker

oder

- Differenzierung von immortalisierten Zellen zu neuralen Vorläuferzellen.
- Isolieren der neuralen Vorläuferzellen unter Verwendung der angegebenen Marker.

[0019] "Unter Verwendung der angegebenen Marker" bedeutet, dass die Zellen isoliert werden, die positiv für mindestens einen der Marker aus der Liste A und B sind, wobei mehrere positive Marker und die Abwesenheit von Markern der Liste C bevorzugt werden. Die Isolierung kann beispielsweise durch FACS Analyse erfol-

gen. Die durch die Verfahren erhältlichen Zellen sind ebenfalls Gegenstand der Erfindung.

4

[0020] Ein weiterer Gegenstand der Erfindung ist die Verwendung mindestens eines Markers ausgewählt aus der Liste A oder Liste B zu Identifizierung oder Isolierung von neuralen Vorläuferzellen.

[0021] Gegenstand ist weiterhin ein Antikörper gegen einen Marker aus der Liste A, B oder C, ein Diagnostikmittel enthaltend mindestens einen, bevorzugt zwei oder mehr Substanzen zur Erkennung der Marker der Liste A, B oder C sowie ein Arzneimittel enthaltend die erfindungsgemäße Zellpopulation.

[0022] Solche Arzneimittel könnten wie oben dargestellt zur Behandlung von neurologischen Krankheiten wie Alzheimer, Parkinson, Folgen von Schädelhirntraumata oder Schlaganfall eingesetzt werden.

[0023] Ein weiterer Gegenstand ist eine Zellpopulation, bei der mindestens 5% der Zellen neurale Stammzellen sind, die wenigstens einen der in Liste D oder Liste E aufgeführten Marker aufweisen.

[0024] Vorzugsweise weisen entsprechende neurale Stammzellen mindestens zwei, bevorzugt mindestens drei, mindestens vier und noch mehr bevorzugt mindestens fünf der in Liste D oder Liste E aufgeführten Marker auf.

[0025] In besonders bevorzugten Ausführungsformen weisen entsprechende neurale Stammzellen keinen der in Liste A oder Liste C aufgeführten Marker auf. [0026] Der Gehalt an neuralen Stammzellen in der Zellpopulation ist möglichst hoch, bevorzugt mindestes 10%, mehr bevorzugt mindestes 25%, mindestens 50%, und am meisten bevorzugt mindestens 90%.

[0027] Entsprechende Zellpopulation sind aus Hirngewebe erhältlich. In einer Ausführungsform handelt es sich um eine murine Zellpopulation.

[0028] Gegenstand ist weiterhin ein Verfahren zur Isolierung der Zellpopulation. Dies ist erhältlich entweder durch

- Entnahme einer Probe aus dem Hirn
 - Isolieren der neuralen Stammzellen unter Verwendung der angegebenen Marker

45 oder

- Differenzierung von embryonalen Stammzellen zu neuralen Stammzellen,
- Isolieren der neuralen Stammzellen unter Verwendung der angegebenen Marker

oder

- Trans-Differenzierung von adulten, nicht neuralen Stammzellen zu neuralen Stammzellen,
 - Isolieren der neuralen Stammzellen unter Verwen-

dung der angegebenen Marker

oder

- De-Differenzierung von adulten, neuralen Vorläuferzellen zu neuralen Stammzellen,
- Isolieren der neuralen Stammzellen unter Verwendung der angegebenen Marker

oder

- Differenzierung von immortalisierten Zellen zu neuralen Stammzellen,
- Isolieren der neuralen Stammzellen unter Verwendung der angegebenen Marker.

[0029] Die Isolierung erfolgt wie oben bei den neuralen Vorläuferzellen angegeben. Auch die auf diesem Wege erhältlichen neuralen Stammzellen sind Gegenstand der Erfindung.

[0030] Gegenstand der Erfindung ist weiterhin ein Antikörper gegen einen Marker aus der Liste D, E, ein Diagnostikmittel enthaltend mindestens einen, bevorzugt zwei oder mehr Substanzen zur Erkennung der Marker der Liste D, E, A oder C sowie ein Arzneimittel enthaltend die erfindungsgemäße Zellpopulation.

[0031] Solche Arzneimitteln können wie dargestellt zur Behandlung von neuronalen Krankheiten wie Alzheimer, Parkinson, Folgen von Schädelhirntraumata oder Schlaganfall eingesetzt werden.

Beispiele

A. Isolierung von embryonaler Stammzellen

[0032] Murine embryonale Stammzellen proliferieren klonal in vitro und sind aus diesem Grunde in großer Menge und hochreiner Form isolierbar. Nach dem Stand der Technik werden diese in Anwesenheit von LIF auf primären embryonalen Fibroblasten gehalten und regelmäßig durch die Generierung von hochgradig keimbahnkompetenten chimären Mäusen auf ihre Qualität überprüft. Unter normalen Kulturbedingungen beträgt das Verhältnis ES-Zellen zu kontaminierenden Fibroblasten etwa 200:1. Um auch diese minoritäre Komponente zu eliminieren, wurden die ES-Zellen vor der RNA-Päparation für zwei Passagen (vier Tage) auf gelatinisierten Kulturplatten bei erhöhter LIF-Konzentration gehalten. Dies emöglicht eine Reduktion der kontaminierenden Fibroblasten auf etwa 0,01% der Gesamtpopulation.

B. Isolierung von neuronalen Vorläuferzellen aus dem adulten Mausgehirn.

[0033] In der subventrikulären Zone des adulten Vor-

derhirns von Vertebraten werden permanent große Mengen von neuralen Vorläuferzellen gebildet (wahrscheinlich < 50000 Zellen/ Tag). Diese Zellen benutzen einen präzise definierten Migrationsweg und eine spezielle Form der Translokation (*Chain migration*) um in den Bulbus olfaktorius zu gelangen. Im Bulbus olfaktorius angelangt differenzieren diese Vorläuferzellen normalerweise in inhibitorische (GABA-erge) Interneurone. Unter bestimmten experimentellen Bedingungen wurde

6

in Differenzierung in Oligodendrozyten und Astrozyten gezeigt.

[0034] Neurale Vorläufer, die einen Differenzierungszustand zwischen einer neuralen Stammzelle und einem terminal differenzierten Neuron repräsentieren, exprimieren spezifisch eine Form des neuralen Zelladhäsionsmoleküls NCAM, die eine spezielle post-translationelle Modifikation aufweist. Diese Modifikation besteht aus der Glykosylierung des Proteins mit a-2,8 verknüpfter Polysialylsäure (PSA). Ein spezifischer Antikörper gegen dieses Glykoepitop (Chazal et al., 2000) erlaubte die hochreine Isolierung der Zielpopulation aus dissozierten Vorderhirngewebe durch FACS (Fluorescence Activated Cell Sorting).

5 C. Molekulargenetische Analyse

[0035] Embryonale Stammzellen und neuronale Vorläuferzellen wurden in einem genomweiten Screen mit der Methode SAGE (Serial Analysis of Gene Expression) analysiert.

[0036] Die Genexpressionsprofile der beiden Zell-Populationen wurden unter Anwendung bioinformatischer Verfahrensweisen mit Maus-Hirn-SAGE-Datenbanken verglichen, um molekulare Marker zu identifizieren, die charakteristisch für embryonale Stammzellen und neuronale Vorläuferzellen sind.

[0037] Mit Hilfe der Microarray technologie wurde die Expression der Gene bestätigt.

[0038] Durch in situ-Hybridisierung in Maushirn und an embryonalen Stammzellen wurde die zelluläre Lokalisation einiger der identifizierten Gene bestimmt. Diese Ergebnisse belegen, dass spezifische Markergene identifiziert werden konnten.

Patentansprüche

 Zellpopulation, dadurch gekennzelchnet, dass mindestens 5% der Zellen neurale Vorläuferzellen sind, die wenigstens einen der in Liste A oder Liste B aufgeführten Marker aufweisen.

- Zellpopulation, dadurch gekennzeichnet, dass mindestens 5% der Zellen, neurale Vorläuferzellen sind, die wenigstens zwei, bevorzugt wenigstens 3 der in Liste A oder Liste B aufgeführten Marker aufweisen.
- Zellpopulation, nach mindestens einem der Ansprüche 1 bis 2, dadurch gekennzelchnet, dass die neuralen Vorläuferzellen keinen in Liste C aufgeführten Marker aufweisen.
- Zellpopulation nach mindestens einem der Ansprüche 1 bis 3, dadurch gekennzelchnet, dass mindestens 25 % der Zellen neurale Vorläuferzellen sind.
- Zellpopulation nach mindestes einem der Ansprüche 1 bis 4, dadurch gekennzeichnet, dass es sich um eine murine Zellpopulation handelt und/ oder die neuralen Vorläuferzellen aus Hirngewebe erhältlich ist.
- Verfahren zur Isolierung einer Zellpopulation nach mindestens einem der Ansprüche 1 bis 5 mit folgenden Schritten:
 - a) Entnahme einer Probe aus dem Hirn
 - b) Isolieren der neuralen Vorläuferzellen unter Verwendung der angegebenen Marker

oder

- a) Differenzierung von embryonalen Stammzellen zu neuralen Vorläuferzellen,
- b) Isolieren der neuralen Vorläuferzellen unter Verwendung der angegebenen Marker

oder

- a) Trans-Differenzierung von adulten, nicht neuralen Stammzellen zu neuralen Vorläuferzellen,
- b) Isolieren der neuralen Vorläuferzellen unter Verwendung der angegebenen Marker

oder

 b) Isolieren der neuralen Vorläuferzellen unter Verwendung der angegebenen Marker

oder

- a) Differenzierung von immortalisierten Zellen zu neuralen Vorläuferzellen,
- b) Isolieren der neuralen Vorläuferzellen unter Verwendung der angegebenen Marker.
- Verwendung mindestens eines Markers ausgewählt aus der Liste A oder Liste B zu Identifizierung oder Isolierung von neuralen Vorläuferzellen.
- Antikörper gegen einen Marker aus der Liste A, B oder C.
- Diagnostikmittel enthaltend mindestens einen, bevorzugt zwei oder mehr Substanzen zur Erkennung der Marker der Liste A, B oder C.
- Arzneimittel enthaltend die Zellpopulation nach einem der Ansprüche 1 bis 5.
- Zellpopulation, dadurch gekennzeichnet, dass mindestens 5% der Zellen neurale Stammzellen sind, die wenigstens einen der in Liste D oder Liste E aufgeführten Marker aufweisen.
- 12. Zellpopulation, dadurch gekennzeichnet, dass mindestens 5% der Zellen neurale Stammzellen sind, die wenigstens zwei, bevorzugt wenigstens 3 der in Liste D oder Liste E aufgeführten Marker aufweisen.
- 13. Zellpopulation, nach mindestens einem der Ansprüche 11 bis 12, dadurch gekennzeichnet, dass die neuralen Stammzellen keinen in Liste A oder Liste C aufgeführten Marker aufweisen.
- Zellpopulation nach mindestens einem der Ansprüche 11-13, dadurch gekennzelchnet, dass mindestens 25% der Zellen neurale Stammzellen sind.
- 15. Zellpopulation nach mindestes einem der Ansprüche 11 bis 14, dadurch gekennzeichnet, dass es sich um eine murine Zellpopulation handelt und/oder die neuralen Stammzellen aus Hirngewebe erhältlich.
- 16. Verfahren zur Isolierung einer Zellpopulation nach mindestens einem der Ansprüche 11 bis 15 mit folgenden Schritten:
 - a) Entnahme einer Probe aus dem Hirn

b) Isolieren der neuralen Stammzellen unter Verwendung der angegebenen Marker

34

oder

- a) Differenzierung von embryonalen Stammzellen zu neuralen Stammzellen,
- b) Isolieren der neuralen Stammzellen unter Verwendung der angegebenen Marker

oder

- a) Trans-Differenzierung von adulten, nicht neuralen Stammzellen zu neuralen Stammzellen.
- b) Isolieren der neuralen Stammzellen unter Verwendung der angegebenen Marker

oder

- a) De-Differenzierung von adulten, neuralen Vorläuferzellen zu neuralen Stammzellen,
- b) Isolieren der neuralen Stammzellen unter Verwendung der angegebenen Marker

oder

- a) Differenzierung von immortalisierten Zellen zu neuralen Stammzellen,
- b) Isolieren der neuralen Stammzellen unter Verwendung der angegebenen Marker.
- Antikörper gegen einen Marker aus der Liste D, E, A oder C.
- 40 18. Diagnostikmittel enthaltend mindestens einen, bevorzugt zwei oder mehr Substanzen zur Erkennung der Marker der Liste D, E, A oder C.
 - Arzneimittel enthaltend die Zellpopulation nach einem der Ansprüche 11 bis 15.

UNVOLLSTÄNDIGE RECHERCHE ERGÄNZUNGSBLATT C

Nummer der Anmeldung EP 03 02 5506

Unvollständig recherchierte Ansprüche: 6, 16

Grund für die Beschränkung der Recherche (nicht patentfähige Erfindung(en)):

Artikel 52 (4) EPÜ – Verfahren zur chirurgischen Behandlung des menschlichen oder tierischen Körpers

Weitere Beschränkung der Recherche

Unvollständig recherchierte Ansprüche: 1-5, 7-15, 17-19

Grund für die Beschränkung der Recherche:

In den Listen A-E, auf die sich in den Patentansprüchen bezogen wird, sind insgesamt etwa 1000 putative Positiv- und Negativmarker neuraler Vorläuferzellen und neuraler Stammzellen aufgelistet. Diese putativen Marker sind teilweise bereits bekannte Proteine, wie z.B. beta-Aktin oder Interleukin 1 alpha, teilweise aber auch undefinierte, als "ESTs" benannte sogenannte Marker oder partielle mRNA-Sequenzen. Aufgrund der grossen Anzahl der putativen Marker und deren tw. mangelhaften Identifikation ist es unmöglich, eine vollständige Recherche zu erstellen.

ANHANG ZUM EUROPÄISCHEN RECHERCHENBERICHT ÜBER DIE EUROPÄISCHE PATENTANMELDUNG NR.

EP 03 02 5506

In diesem Anhang sind die Mitglieder der Patentfamilien der im obengenannten europäischen Recherchenbericht angeführten Patentdokumente angegeben.
Die Angaben über die Familienmitglieder entsprechen dem Stand der Datei des Europäischen Patentamts am Diese Angaben dienen nur zur Unterrichtung und erfolgen ohne Gewähr.
